1 Integral Basics

5.3 Average Value

Integrals are pretty much an infinite amount of Riemann sums. If f is integrable on $[a, b]$, then its average value (or mean) on $[a, b]$ is $\frac{1}{b-a}\int_a^b f(x)dx$.

5.5 U-Substitution

Since du can be substituted for $(/fracdudx)dx$ u-substitution is possible.
Ex. Find $\int(x^3+x)^5(3x^2+1)dx$

$$\begin{aligned}
\int_a^b (x^3+x)^5(3x^2+1)dx \\
\int_a^b (u)^5(3x^2+1)dx \\
u = x^3+x \\
\frac{du}{dx} = 3x^2+1 \\
\int_{a^3+a}^{b^3+b} (u)^5(\frac{du}{dx})dx \\
\int_{a^3+a}^{b^3+b} (u)^5 du \\
\int_{a^3+a}^{b^3+b} (u)^5 du \\
\frac{(b^3+b)^6}{6} - \frac{(a^3+a)^6}{6}
\end{aligned} \tag{1}$$

5.6 Area Between Curves

If $f(x) \geq g(x)$ for $[a, b]$, then the area between both curves from a to b is equal to $A = \int_a^b [f(x) - g(x)]dx$.

6.1 Volume Using Integrals: Disk and Washer Methods

The volume of a solid of integrable cross-sectional area $A(x)$ from $x = a$ to $x = b$ is equal to $\int_a^b A(x)dx$.
The volume of a disk created by rotating a function $R(x)$ around $y = 0$ (the x-axis) for the same bounds is equal to $\int_a^b \pi[R(x)]^2dx$.
The volume of a disk created by rotating a function $R(y)$ around $x = 3$ for the same bounds is equal to $\int_{R((a)}^{R(b)} \pi[R(y) - 3]^2dy$.
The reason 3 is subtracted from $R(y)$ is because the axis of rotation is closer to the area being rotated, so the radius of rotation will be less than if $x = 0$.
The volume of a washer created by rotating the space between $R(x)$ and $r(x)$ around $y = 1$ is equal to $\int_a^b \pi([R(x) - 1]^2 - [r(x) - 1]^2)dx$. The reason a 1 is subtracted is because the axis of rotation is closer to the area being rotated, so the radius of rotation will be less than if $y = 0$.
The volume of a washer created by rotating the space between R(y) and r(y) around x=0 (the y-axis) is equal to $\int_{R(a)}^{R(b)} \pi([R(y)]^2 - [r(y)]^2)dx$.

6.3 Arc Length

Pythagorean's Theoreom can be applied to find the length of a segment $f(x)$. If ds is equal to a single straight segment in $f(x)$, then dx is equal to the horizontal length and dy is equal to its vertical length.

$$\begin{aligned} (ds)^2 &= (dx)^2 + (dy)^2 \\ \sqrt{(ds)^2} &= \sqrt{(dx)^2 + (dy)^2} \\ ds = dx&\sqrt{(dx)^2/(dx)^2 + (dy)^2/(dx)^2} \\ ds &= \sqrt{1 + (dy/dx)^2}dx \end{aligned} \tag{2}$$

By taking the integral of this, you can get the total length of the segment.

$$s = \int_a^b \sqrt{1 + (f(x))^2}\, dx \tag{3}$$
